Webinar 5 March: Early Warning Systems and Collection Models Us

Our experience supporting leading European banking institutions in the area of credit risk management continues to show us that the development and implementation of robust Early Warning Systems (EWS) supplemented by an integrated collections strategy are not only powerful loss mitigation tools but can also generate significant operational efficiencies with an improved customer journey. An effective EWS enables the rapid identification of emerging credit risk related trends, which allows banks to take appropriate action in a timely fashion. This could be via limiting further exposure to certain customer segments or triggering proactive contact to at-risk customers to discuss possible restructuring options. Furthermore, an intelligent collections strategy aims to follow a targeted approach by using the right strategy for the right client to maximise recoveries whilst keeping operational expenses in check.

In this webinar we will share our knowledge of industry best practices on the design, implementation and other ideas for further development of both of these closely linked areas of credit risk management in a practical fashion aligned to the goals of your business.

The webinar will be led by our international experts in credit risk modelling, portfolio management and collections. The session will consist of a presentation on these topics, followed by a 30?minute Q&A segment where we will address questions received during the webinar.
